Horizontal Bag Filters

Horizontal bag filters are suitable for a set-up in low overall heights with a horizontal installation as well as functional position of the filter elements.

This way, they are also used on cruise ships as electrostatic precipitator behind waste incineration plants, for example.

Currently, models with filter areas of 35 m^2 – 178 m^2 are available.

Like all our filters, horizontal filters can also be designed as a bunker top filter without dust collection hopper.
